About this guide

Welcome to Qualys Cloud Platform and security scanning in the Cloud! We'll help you get acquainted with the Qualys solutions for scanning your Cloud IT infrastructure by using the Qualys Cloud Security Platform.

About Qualys

Qualys, Inc. (NASDAQ: QLYS) is a pioneer and leading provider of cloud-based security and compliance solutions. The Qualys Cloud Platform and its integrated apps help businesses simplify security operations and lower the cost of compliance by delivering critical security intelligence on demand and automating the full spectrum of auditing, compliance and protection for IT systems and web applications.

Founded in 1999, Qualys has established strategic partnerships with leading managed service providers and consulting organizations including Accenture, BT, Cognizant Technology Solutions, Deutsche Telekom, Fujitsu, HCL, HP Enterprise, IBM, Infosys, NTT, Optiv, SecureWorks, Tata Communications, Verizon and Wipro. The company is also a founding member of the [Cloud Security Alliance \(CSA\)](#). For more information, visit www.qualys.com

Qualys Support

Qualys is committed to providing you with the most thorough support. Through online documentation, telephone help, and direct email support, Qualys ensures that your questions will be answered in the fastest time possible. We support you 7 days a week, 24 hours a day. Access support information at www.qualys.com/support/

Introduction

Welcome to Qualys Cloud Platform that brings you solutions for securing your Cloud IT Infrastructure as well as your traditional IT infrastructure. In this guide, let's talk about securing your Google Cloud Platform infrastructure by using Qualys Cloud Platform.

Qualys Cloud Platform

As a unified architecture that powers more than 15 Qualys security and compliance Cloud Apps, the Qualys Cloud Platform offers you a streamlined solution for avoiding the cost and complexities of managing multiple security vendors. By automatically gathering and analyzing security and compliance data from IT assets anywhere in one single-pane view, the Qualys Cloud Platform gives you the scalability, visibility, accuracy, and breadth of capabilities to fight cyber-attacks and build security into your digital transformation initiatives.

If you're new to Qualys, we recommend you visit the [Qualys Cloud Platform](#) web page to know more about our cloud platform.

| ASSET MANAGEMENT | IT SECURITY | COMPLIANCE | CLOUD / CONTAINER SECURITY | WEB APP SECURITY |

Qualys Integration with Google Cloud Security Command Center: Overview

You can now integrate Qualys Cloud Platform with the Cloud Security Command Center (Cloud SCC) for Google Cloud Platform (GCP), a security and data risk platform helping enterprises to gather data, identify threats, and act on them before they result in business damage or loss.

Cloud SCC provides security teams a single pane for security features, policies, and insights across GCP. Qualys' integration expands on existing data within the Cloud SCC by adding vulnerability management and threat data for compute engine instances within a GCP project.

This capability gives customers visibility of Qualys data within Cloud SCC and allows DevOps and security teams to protect their workloads by gaining full visibility of vulnerability and threat posture at a glance. Users can further drill-down to find details and actionable intelligence for every identified vulnerability and can navigate with a single-click back to their Qualys subscription for additional reports and threat intelligence.

Customers can gain access to Qualys-generated vulnerability and threat posture data within Cloud SCC by deploying Qualys' lightweight Cloud Agents on workload images. This step either bakes the agent within the image or automatically deploys the agent on the compute engine instance.

Prerequisites

For the Qualys Integration with Google Cloud Security Command Center, the following options must be enabled for your Qualys subscription.

Active Qualys subscription:

To leverage the Qualys data collection, evaluation, and reporting capabilities for your GCP VM instances, you must first have an active Qualys subscription. For more details, contact [Qualys Support](#) or [sign up for a free trial](#).

Qualys Applications:

- You must have the [Qualys Vulnerability Management \(VM/VMDR\)](#) and [Qualys Cloud Agent](#) modules enabled in your subscription.
- Cloud Agents must be installed on your GCP VM instances. For more information, see [Deploying Qualys Cloud Agent from Google Cloud Console](#).
- As an alternative to Cloud Agent, you can add Virtual Scanner Appliances and configure them for your GCP instances. GCP VM instance must be able to reach the Qualys Cloud Platform over the HTTPS port 443. You will also need a scanner personalization code (14 digits) which is used to deploy the Virtual Scanner Appliance. For every new virtual scanner appliance, you must generate a new personalization code. For more information, see [Deploying Virtual Scanner Appliance in Google Compute Engine \(GCP\)](#).

Roles:

- You must have the **Manager** or the **Unit Manager** role in your Qualys subscription.
- You must have the following Cloud Identity and Access Management (Cloud IAM) roles to set up Security Command Center in Google cloud console:

Organization Admin (roles/resourcemanager.organizationAdmin)

Security Center Admin (roles/securitycenter.admin)

Security Center Settings Admin (roles/securitycenter.settingsAdmin)

Security Admin (roles/iam.securityAdmin)

Service Account Creator (roles/iam.serviceAccountCreator)

To learn more, see [Security Command Center roles](#).

Google Cloud Security Command Center (SCC):

Security Command Center must be enabled for your organization. For more details, see [Quickstarts for Security Command Center](#).

Security Command Center API:

You must enable the Security Command Center APIs for the selected project. To know more, see [Enable and disable Google APIs](#).

GCP Metadata

The following cloud provider metadata is provided by Qualys Cloud Agent and Qualys Virtual Scanner Appliance.

Metadata provided by Qualys Cloud Agent

General:

- Instance ID
- Host Name
- Machine Type
- Zone
- Project Number
- Project ID

Network:

- Private IP Address
- MAC Address
- VPC Network
- Public IP Address
- Network Interfaces

Metadata provided by Qualys Virtual Scanner Appliance

QID-45465 Google Cloud Platform (GCP) Linux Instance Metadata:

- CPU-platform
- Description
- Hostname
- ID

- Image
- Machine-type
- Maintenance-event
- Name
- Tags
- Zone

Read more about [Dynamic Tagging by Using GCP Metadata](#).

Scanning in GCP Environments

In this section, let's take a look at some common use cases for scanning a GCP environment.

Networking Basics

To start with, let's get familiar with a few terms in networking basics.

VPC networks

A Virtual Private Cloud (VPC) network provides networking functionality for Google Compute Engine Virtual Machine (VM) instances. This pretty much resembles a traditional network in your own data center, except that it is virtualized within Google cloud. Without a VPC Network, you cannot create VM instances. It is a global resource; but an organization may want to separate their deployment environments, and so, they create VPCs for isolation purposes.

VPC Peering

This is a networking connection between two VPCs that enables you to connect VM instances hosted in separate VPC networks and route traffic between them.

Subnets

These are one or more useful IP range partitions in each VPC network. It is a regional resource.

To understand the scanning procedure, see [Scanning Assets](#).

Use Cases for Scanning GCP environment

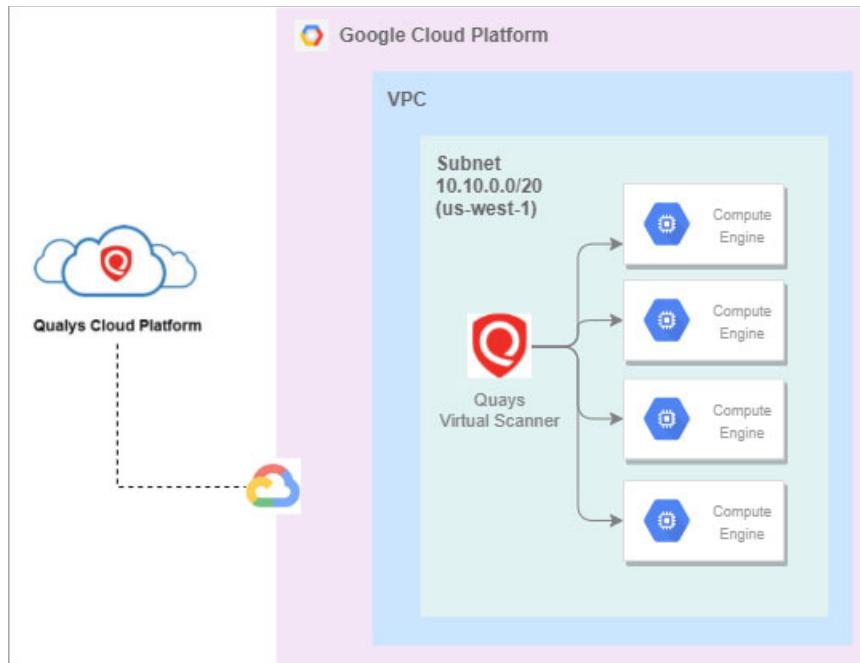

The following are a few common use cases for scanning a GCP environment. You must configure your virtual scanner appliances to communicate to Qualys Cloud Platform over HTTPS (via firewall rules and proper routing).

- Single scanner to scan multiple instances in a VPC in a single region
- Multiple scanners to scan multiple instances in a VPC in a single region
- Single scanner to scan multiple instances across subnets in different regions in a VPC
- Multiple scanners to scan multiple instances across subnets in different regions in a VPC
- Single scanner to scan multiple instances across subnets in different regions across peered VPCs
- Multiple scanners to scan multiple instances across subnets in different regions across peered VPCs
- Scanner cannot scan instances in non-peered VPC

- Scanner cannot scan instances in VPCs with overlapping IP address

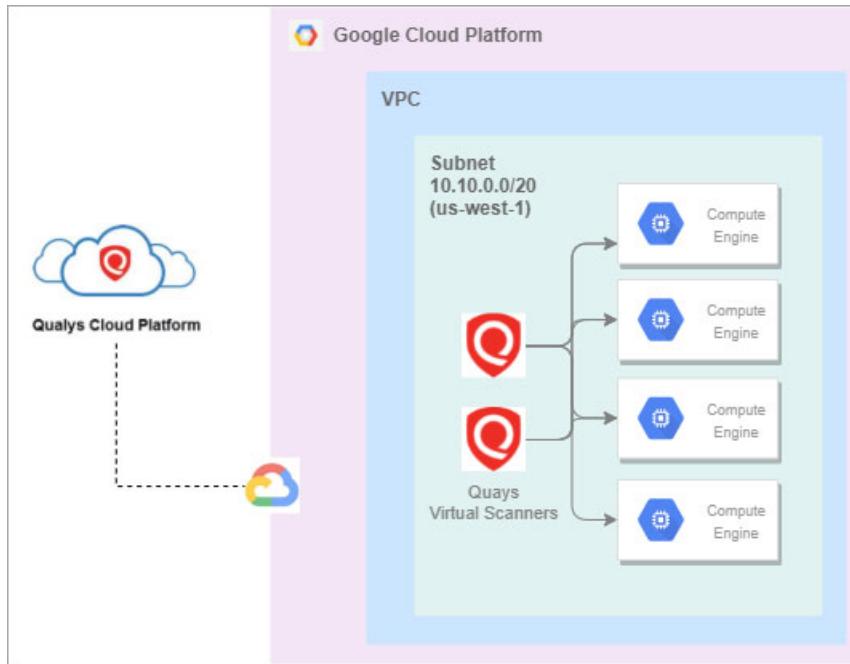

Single scanner to scan multiple instances in a VPC in a single region

A single Qualys scanner appliance can be configured to scan multiple GCP VM instances running in a single VPC in a single region.

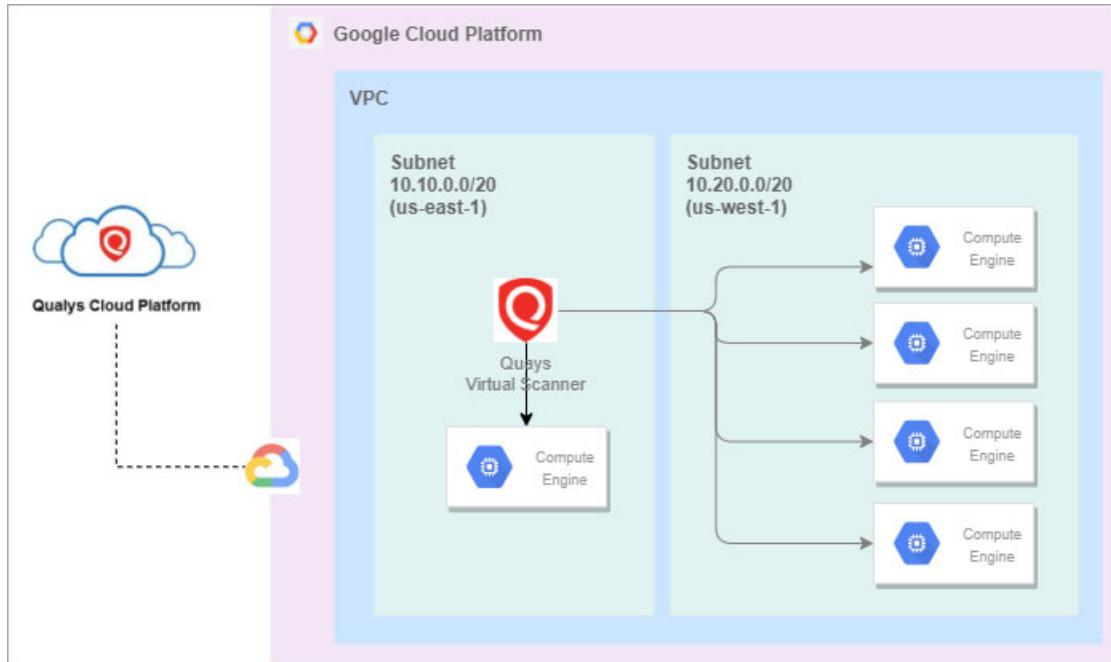

Multiple scanners to scan multiple instances in a VPC in a single region

Based on the number of VM **instances** and scan frequency, multiple scanners might be required to scan multiple VM Instances in a subnet in a VPC. You can add more scanners based on requirements.

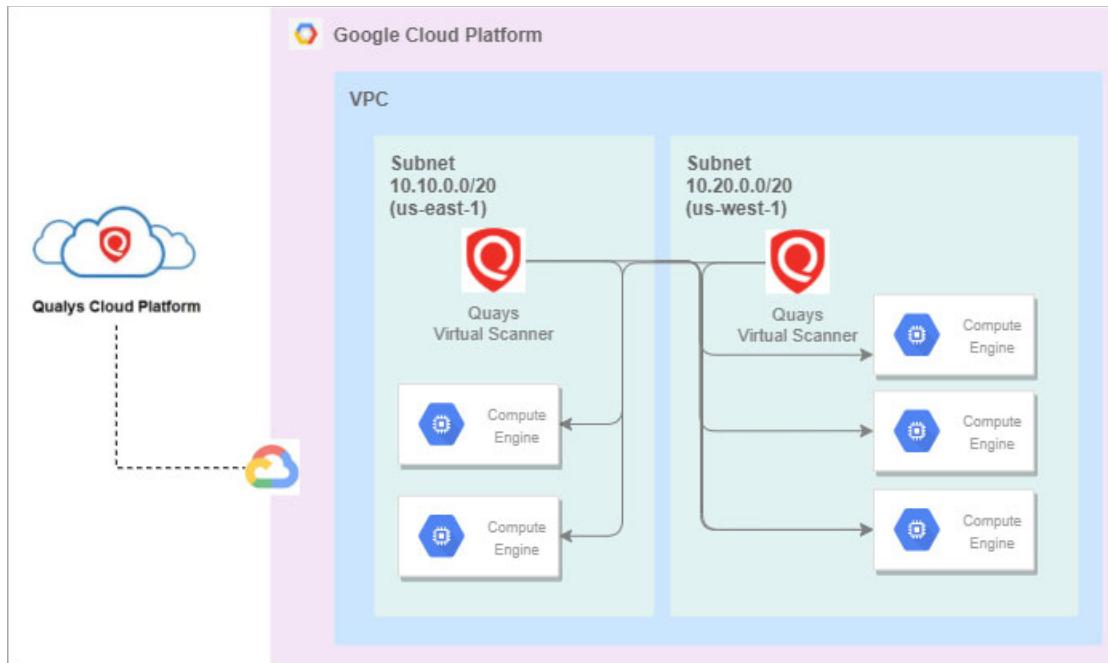

Single scanner to scan multiple instances across subnets in different regions in a VPC

A single scanner can reach multiple VM instances across different subnetworks in different regions within a single VPC.

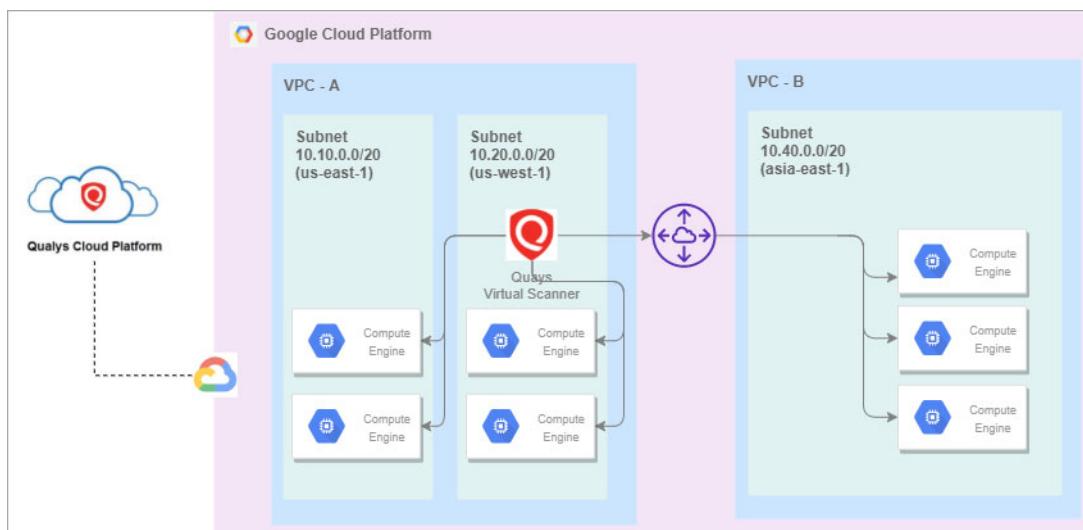

Multiple scanners to scan multiple instances across subnets in different regions in a VPC

Based on the number of VM instances and scan frequency, multiple scanners might be required to scan multiple VM instances across subnets in different regions in a VPC. You can add more scanners based on requirements.

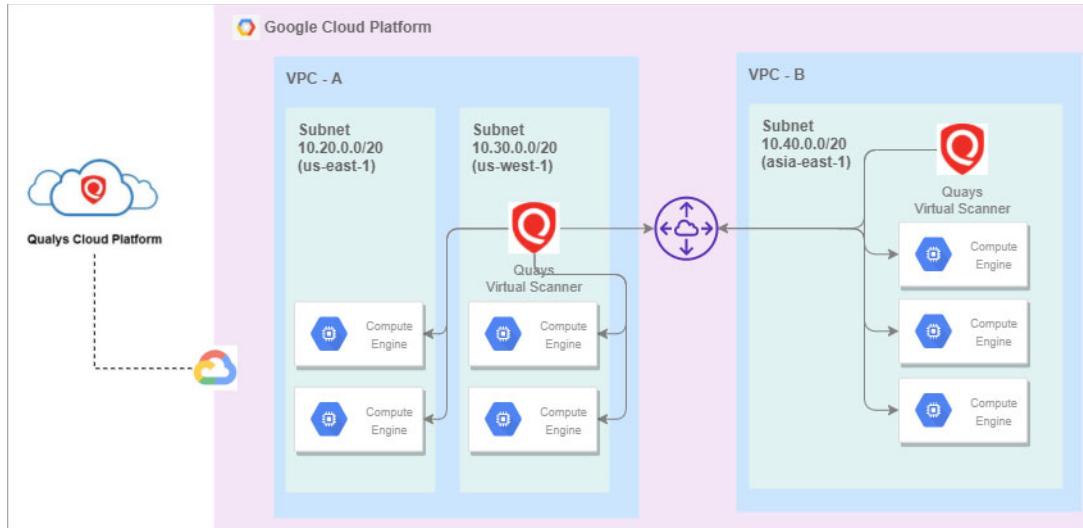

Single scanner to scan multiple instances across subnets in different regions across peered VPCs

A single scanner can reach multiple VM instances in different regions and subnets in a peered VPC.

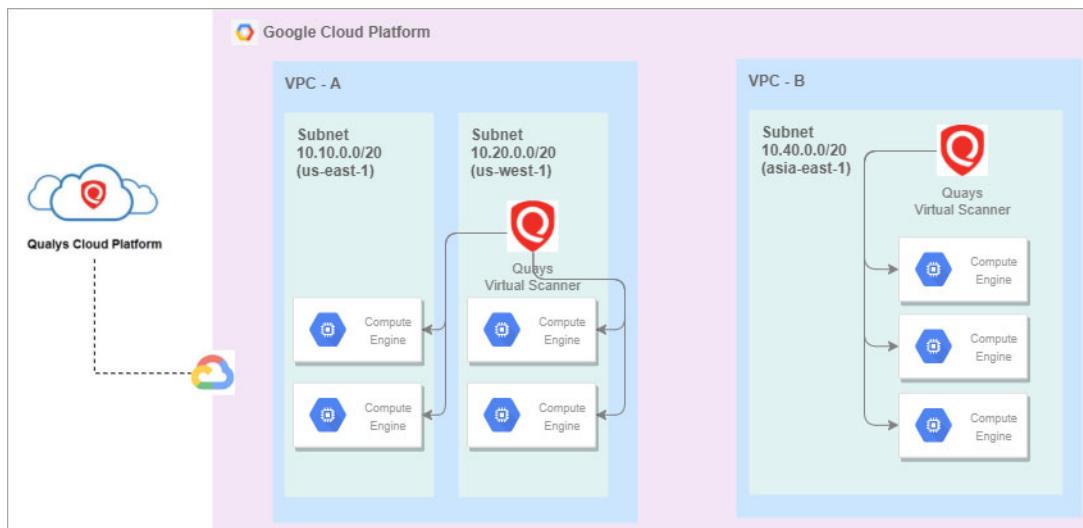

Multiple scanners to scan multiple instances across subnets in different regions across peered VPCs

Based on the number of machines and scan frequency, multiple scanners might be required to scan multiple VM instances across peered VPCs in different regions.

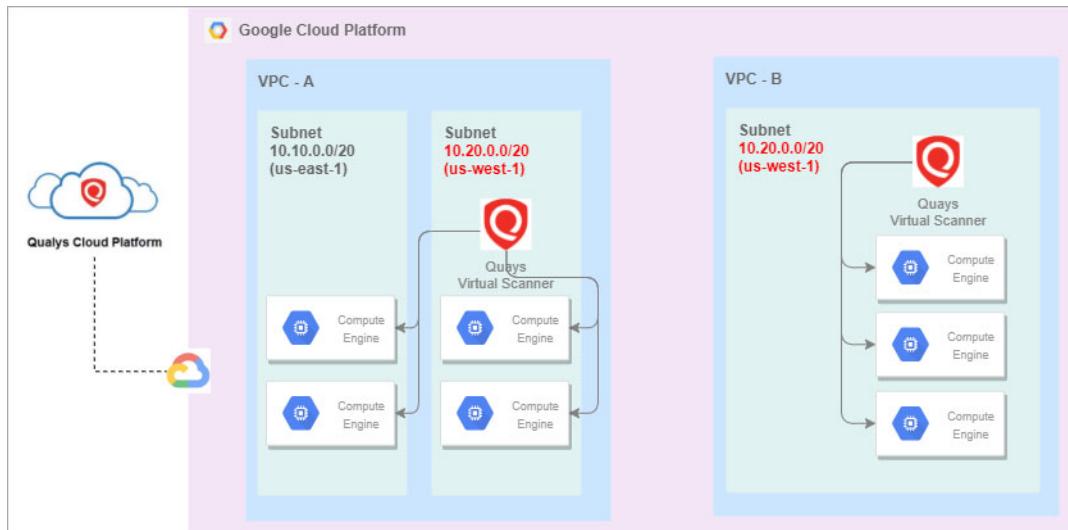

Scanner cannot scan instances in non-peered VPC

Scanner's reachability is curtailed if the VPCs are not peered. In non-peered VPCs, scanners cannot reach the VM instances to launch a scan.

Scanner cannot scan instances in VPCs with overlapping IP address

A single scanner cannot scan VM instances in VPCs with overlapping IP addresses due to reachability issues. Add more scanner appliances based on your requirements to allow scanning across VPC boundaries.

In case of regions displayed in the sample screenshot, VPC peering cannot be configured between VPC-A and VPC-B. So, in this case, scanner in VPC-A cannot reach VM instances in VPC-B as VPC-A and VPC-B have one overlapping IP Address (10.20.0.0/20).

To understand the scanning procedure, see [Scanning Assets](#).

Deploying Sensors

Qualys sensors, a core service of the Qualys Cloud Platform, make it easy to extend your security throughout your global enterprise. These sensors are remotely deployable, centrally managed and self-updating. They collect the data and automatically beam it up to the Qualys Cloud Platform, which has the computing power to continuously analyze and correlate the information in order to help you identify threats and eliminate vulnerabilities.

Prior to scanning, you need to deploy sensors. Depending on your preference, you can deploy a virtual scanner appliance or a Qualys Cloud Agent. Let's go through the steps involved in deploying these sensors.

-[Deploying Virtual Scanner Appliance in Google Compute Engine \(GCP\)](#)

-[Deploying Qualys Cloud Agent from Google Cloud Console](#)

Deploying Virtual Scanner Appliance in Google Compute Engine (GCP)

You can scan your Google Cloud Compute Engine instances along with all other global elastic cloud and on-premise assets from within the Qualys Cloud Platform. Qualys Virtual Scanner Appliance can be directly deployed from the Google Marketplace.

Scanner deployment involves configuration in Qualys Cloud Platform as well as GCP.

Before we know the steps to deploy a virtual scanner, let's understand the licensing/cost aspect and the deployment recommendations.

Cost and Licenses

Qualys Virtual Scanner Appliance is available as an image at Google Cloud Marketplace, ready for customers to launch onto GCP Virtual Machines. There are two aspects to consider:

-Qualys costs for the virtual scanner license subscription.

-GCP costs for the computing resources to run the appliance as a virtual machine.

Note: Ensure that you use the image available at Google Cloud Marketplace or the Signed URL provided by Qualys for downloadable GCP-specific images. Using images downloaded from Qualys UI are not recommended to be used on GCP.

Qualys Cost

You need to acquire a Qualys license for each virtual scanner appliance instance that you would like to run. This license is acquired from Qualys, not from GCP, and our scanner appliances are listed at Google Cloud Marketplace with a Bring Your Own License (BYOL) model accordingly. Each Qualys Virtual Scanner Appliance profile that you define in the Qualys Cloud Platform UI will consume a single virtual scanner appliance license. If you delete a virtual scanner appliance profile from your Qualys subscription, that license is

freed up and immediately available for re-use. However, the personalization code that you generate to register a scanner appliance can be used only once. For every new virtual scanner appliance, you must generate a new personalization code.

Contact your Qualys technical account manager or Qualys reseller for a pricing quotation or to request evaluation.

GCP Cost

For each virtual scanner appliance, virtual machine is launched into one of your own GCP accounts. You are responsible for paying Google for the costs of running the appliance. Those costs include:

- Compute Capacity based upon size
- Storage
- Data transfer IN/OUT

The compute capacity charges (i.e., CPU, RAM) are overwhelmingly the largest part of the costs to run an Instance. Note that you may not need to keep your scanner appliances running at all times. Any hours during which your virtual machine is stopped, only per-GB-provisioned storage charges are incurred. For those able to spend a little more upfront, GCP virtual machines can be reserved by financially committing for one or three years to save. However, scanners should be turned on for at least several hours per week in order to ensure that they stay up to date with software and signatures.

Deployment Recommendations for Scanner

Following are some recommendations from Qualys for deploying scanners based on the network topology and the size of the GCP instance for hosting the scanner appliance.

Instance Snapshots or Cloning Not Allowed

Using a snapshot or clone of a virtual scanner instance to create a new instance is strictly prohibited. The new instance does not function as a scanner. All configuration settings and platform registration information will be lost. This could also lead to scans failing and errors for the original scanner.

Moving or Exporting Instance Not Allowed

Moving or exporting a registered scanner instance from a virtualization platform (HyperV, VMware, XenServer) in any file format to the Google Cloud Platform is strictly prohibited. This breaks scanner functionality and the scanner permanently loses all its settings.

Virtual Machine Size for Hosting the Scanner

The default sizing for a Qualys Virtual Scanner Appliance is 2 vCPU and 7.5 GB memory and can be customized. The maximum supported limit by Qualys is 16 CPUs and 16 GB RAM. Based on the frequency of scanning, and the number of GCP Virtual machines that are being scanned, you can scale up to machine t16 CPUs and 16 GB RAM. For customization, choose core to memory in the ratio of 1:3.5.

What Do I Need?

The Virtual Scanner option must be turned on for your account. Contact Qualys Support or your Technical Account Manager if you would like us to turn on this option for you.

You must be a Manager or a sub-user with the "Manage virtual scanner appliances" permission. This permission may be granted to Unit Managers. Your subscription may be configured to allow this permission to be granted to Scanners.

What Is Not Supported?

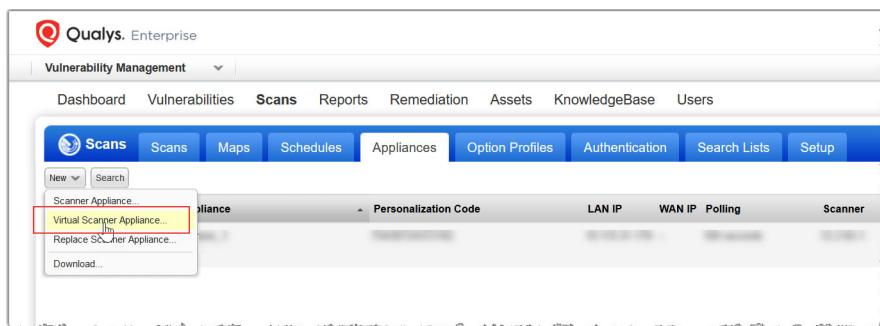

The following features are not supported and are disabled in all cloud (private and public) platforms:

- WAN/Split network SETTINGS - "WAN Interface" option for split network settings is not available from Scanner UI/console. Only LAN/single network settings from Cloud UI, used for both scanning and connecting to Qualys servers, are supported.
- NATIVE VLAN - "VLAN on LAN" option for configuring Native VLAN is not available from scanner UI/console.
- STATIC VLAN (IPV4 AND IPV6) - "VLANs" option for configuring static VLANs is not available from Qualys UI.
- STATIC ROUTES (IPV4 AND IPV6) - Option to configure "Static Routes" is not available from Qualys UI.
- IPV6 ON LAN - Option to configure "IPv6 on LAN" is not available from Qualys UI.

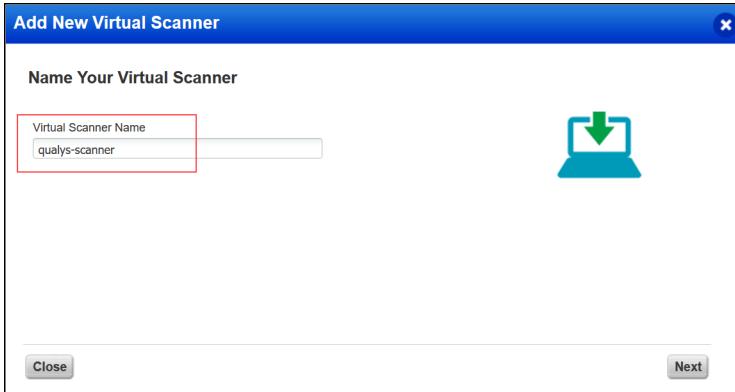

Generating a Personalization Code

Get a personalization code from your Qualys Cloud Platform subscription to register every new appliance instance. To get the code, do the following:

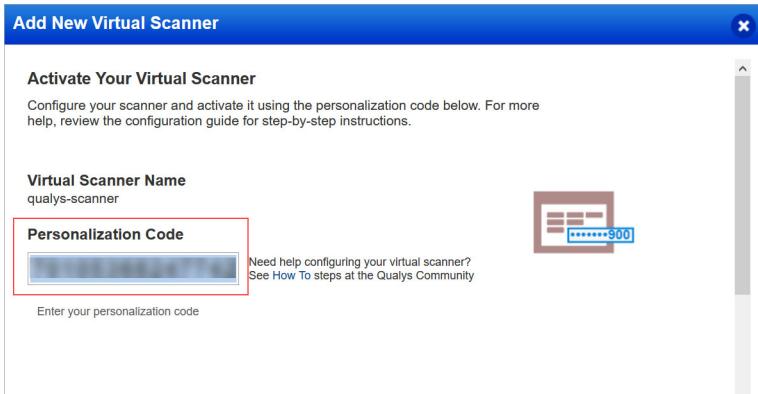

1. Log in to the Qualys UI.
2. From the module picker in the left, choose **Vulnerability Management** or **Policy Compliance**, depending on your scanning needs.
3. Go to **Scans > Appliances** and select **New > Virtual Scanner Appliance**.

4. In the **Add New Virtual Scanner** dialog box, click **Continue** in the **I Have My Image** section. Give your virtual scanner a name. As per the GCP naming conventions, you can use lowercase letters, numbers, and hyphens in the scanner name.

5. Click **Next** to walk through the wizard. Copy the personalization code.

6. Keep this window open and switch to your Google Cloud Portal to launch the appliance. You can check for activation status in the same window after deployment.

Launching Virtual Scanner Appliance

You can deploy a Qualys Virtual Scanner Appliance by either of the following ways:

- [Deploying scanner from Google Cloud Marketplace](#)
- [Deploying Custom Image on Private Cloud Platforms using Cloud Console](#)

Deploying scanner from Google Cloud Marketplace

1. Sign in to Google Cloud Platform and navigate to [Marketplace](#).
2. In the **Search** box, type Qualys, and then from the search results, click **Qualys Virtual Scanner Appliance**.

The screenshot shows the Google Cloud Marketplace search results for 'qualys'. There are four results listed under the heading '4 results':

- Qualys Cloud Agent**: Qualys, Inc. - APIs & services. Continuously assess your security and compliance posture.
- Qualys Virtual Firewall Appliance**: Qualys, Inc. - Virtual machines. Protect your web applications against attacks.
- Qualys Virtual Scanner Appliance**: Qualys, Inc. - Virtual machines. Continuously assess your security and compliance posture. This item is highlighted with a red box.
- Qualys Security for Cloud SCC**: Qualys, Inc. - APIs & services. Everything visible. Everything secure.

On the left side, there are filters for **TYPE** (APIs & services, Virtual machines), **CATEGORY** (Compute, Healthcare, Monitoring, Networking, Security, Security Command Center), and **PRICE** (Paid, BYOL).

3. Click **Launch**.

The screenshot shows the product page for the 'Qualys Virtual Scanner Appliance'. It includes:

- The Qualys logo.
- The product name: **Qualys Virtual Scanner Appliance**.
- The provider: **Qualys, Inc.**.
- A note: 'Estimated costs: \$ [REDACTED] /month + BYOL license fee'.
- A description: 'Continuously assess your security and compliance posture'.
- A large blue **LAUNCH** button, which is highlighted with a red box.
- A link: '1 PAST DEPLOYMENT'.

At the bottom, there are tabs for 'Runs on Google Compute Engine' and 'Overview'.

4. Provide the following details for the virtual scanner appliance instance:

Deployment name: It is advised to specify the same name that you use on the Qualys Cloud Platform while generating a personalization code.

Zone: Select a zone that co-locates the scanner instance with scan target instances. For the scanner to reach other zones, setup connectivity with appropriate network configurations is needed.

Machine type: The default pre-set is 2 vCPU and 7.5 GB memory and can be customized.

Note: The appliance supports a maximum of 16 cores and 16GB memory. For customization, choose core to memory in the ratio of 1:3.5.

Personalization code: Provide the 14-digit personalization code generated from Qualys Cloud Platform. This is a one-time use code only. To register every new virtual scanner appliance instance, you must generate a fresh personalization code.

Proxy URL (Optional): Add the proxy server URL to communicate with Qualys Cloud Platform via SSL tunneling proxy. We support both IP and FQDN for the proxy server configuration. Specify the proxy server URL as `username:password@proxyhost:port`

Syntax for proxy URL

- If you have a domain user, use this syntax:
`domain\username:password@proxyhost:port`
- If authentication is not used, use this syntax:
`proxyhost:port`
where proxyhost is the IP address or the FQDN of the proxy server and port is the proxy port.

Examples

- `doe:abc12345@10.40.1.123:3128`
- `jdoe:abc12345@miproxy.qualys.com:3128`

Boot Disk

Do not change the following values unless instructed by Qualys Support:

Boot disk type: Standard Persistent Disk

Boot disk size in GB: 56

The screenshot shows the 'New Qualys Virtual Scanner Appliance deployment' page in the Google Cloud Platform. The deployment name is set to 'qualys-virtual-scanner-appliance-1'. The zone is 'us-west2-a'. The machine type is '1 vCPU' with '3.75 GB memory'. The personalization code field contains a redacted value. The proxy URL is 'proxy_user:proxy_pass@proxyhost:port'. The boot disk type is 'Standard Persistent Disk' and the size is '56'. Under networking, there is a single network interface named 'default'. A note at the bottom states 'You have reached the maximum number of one network interface'. The 'Deploy' button at the bottom left is highlighted with a red box.

5. Click **Deploy** and follow to the section Post-deployment Progress and Monitoring.

Deploying Custom Image on Private Cloud Platforms

We can deploy custom Image on private cloud using following ways.

[Deploying Custom Image on Private Cloud Platforms using Cloud Console](#)

[Deploying Custom Image on Private Cloud Platforms using gcloud Command-line Tool](#)

Deploying Custom Image on Private Cloud Platforms using Cloud Console

Here you are expected to build a Qualys scanner image specific to your private cloud platform. Do the following:

1. Download the qVSA image file (tar.gz) by using the SAS link provided by Qualys Operations. For more details, contact Qualys Support.
2. Create a Google Storage Bucket.
3. Upload the downloaded qVSA image file to your storage bucket.
4. Create the Qualys Scanner Image by using the uploaded QVSA Image file (tar.gz) file.
5. Provide the following details for the virtual scanner appliance instance custom image:

Name: Provide a unique name to identify the Qualys Scanner appliance image.

Source: Select **Cloud Storage File** which allows you to select the Qualys Scanner image file stored in the Storage Bucket. In the following image, qualys-scanner is a bucket name and qVSA-GCE-xxxxxx.tar.gz is the Qualys scanner image file.

Deploying Custom Image on Private Cloud Platforms using gcloud using Command-lineTool

This section describes how to deploy a Qualys Virtual Scanner Appliance using the Google gcloud CLI tool. First, you need to create a Qualys scanner image from a qVSA image link provided to you by Qualys Operations. Once you've created the image, you can use the gcloud tool to deploy a Qualys Virtual Scanner Appliance in Google Cloud. This scanner,

once deployed, will function as a standard Virtual Scanner and can scan based on IP address or CIDR block.

Step 1: Create a Qualys Scanner image in GCE with gcloud tool using options given below.

Option 1: Create a Qualys Scanner image from the SAS URL provided to you by Qualys by using this command.

```
gcloud compute images create IMAGE_NAME --project PROJECT --  
source-uri=SOURCE_URI
```

Example:

```
gcloud compute images create qualys-scanner --project my-project --  
sourceuri="  
https://storage.googleapis.com/qvsas-image-upload-non-  
regional/qVSAGCE.  
PCP.1234-2.7.29-1.tar.gz?x-googsignature=

signedheaders=host"
```

Option 2: Create a Qualys scanner image in GCE from a tar.gz file.

Customers are expected to build a Qualys Scanner image specific to their private platform.

- 1) Download the qVSA image file (tar.gz) using the signed link provided by Qualys Operations.
- 2) Upload the downloaded qVSA image file to a storage bucket in your Google cloud project
- 3) Create the Qualys Scanner Image using the already uploaded tar.gz file.

Use this command:

```
gcloud compute images create IMAGE_NAME --project PROJECT --  
source-uri=SOIURCE_URI 30 Securing GCP with Qualys Deploying  
Sensors
```

Example:

```
gcloud compute images create qvsScanner -project my-project --  
sourceuri="  
gs://qvsScanner/qVSA-GCE-2.7.29-4.tar.gz"
```

Step 2: Deploy a Qualys Virtual Scanner Appliance in Google Cloud

The following gcloud command will create an instance with no service account assigned to it. Please note that the "metadata" option is where PERSCODE and Proxy server configuration should be specified, separated by comma.

Use this command:

```
gcloud compute instances create INSTANCE_NAME --image-  
project=IMAGE_PROJECT --image=IMAGE --zone=ZONE --custom-  
cpu=CUSTOM_CPU --custom-memory=CUSTOM_MEMORY --  
metadata=KEY=VALUE, [KEY=VALUE] --no-scopes --no-service-account
```

Example:

```
gcloud compute instances create vscanner --image-  
project=my_project --image=qvsScanner-gce-2-7-29-5 --zone us-east1-b --  
custom-cpu=2 --custom-memory=2048MiB --  
metadata=PERSCODE=12345678901234,  
PROXY_URL=proxy_user:proxy_paswd@10.1.2.3:8080 --no-scopes --no-  
service-account
```

Note: To deploy Qualys Virtual Scanner Appliance using latest Marketplace image via Google Cloud CLI using following command

```
gcloud compute instances create INSTANCE_NAME --image-  
project=IMAGE_PROJECT -image-family=IMAGE_FAMILY --zone=ZONE --  
custom-cpu=CUSTOM_CPU --custom-memory=CUSTOM_MEMORY --  
metadata=KEY=VALUE, [KEY=VALUE] --no-scopes --no-service-account
```

Use following options for image family and image project to get the latest Qualys Virtual Scanner Appliance image from Marketplace:

```
--image-family=qvsScanner --image-project=qualys-gcp-security
```

Example:

```
gcloud compute instances create vscanner --image-family=qvsScanner --  
image-project=qualys-gcp-security --zone us-east1-b --custom-cpu=2  
--custom-memory=2048MiB --metadata=PERSCODE=12345678901234,  
PROXY_URL=proxy_user:proxy_paswd@10.1.2.3:8080 --no-scopes --no-  
service-account
```

Post-deployment Progress and Monitoring

Deployment of the Qualys Virtual Scanner Appliance can take up to 10 minutes. Upon deployment, the appliance connects with the Qualys Cloud Platform to complete registration. The appliance also downloads the latest software and vulnerability signatures.

You can monitor the progress of the instance creation in the GCE VM instances.

To view further progress of the appliance configuration or to diagnose any issues, look at the serial console output. Click 'Serial port 1 (console)' in the logs section.

The screenshot shows the 'Logs' section of the Google Cloud Platform interface. A red box highlights the 'Serial port 1 (console)' link under the 'Cloud Logging' heading. Other links visible include 'Serial port 2', 'Serial port 3', 'Serial port 4', and 'Less'.

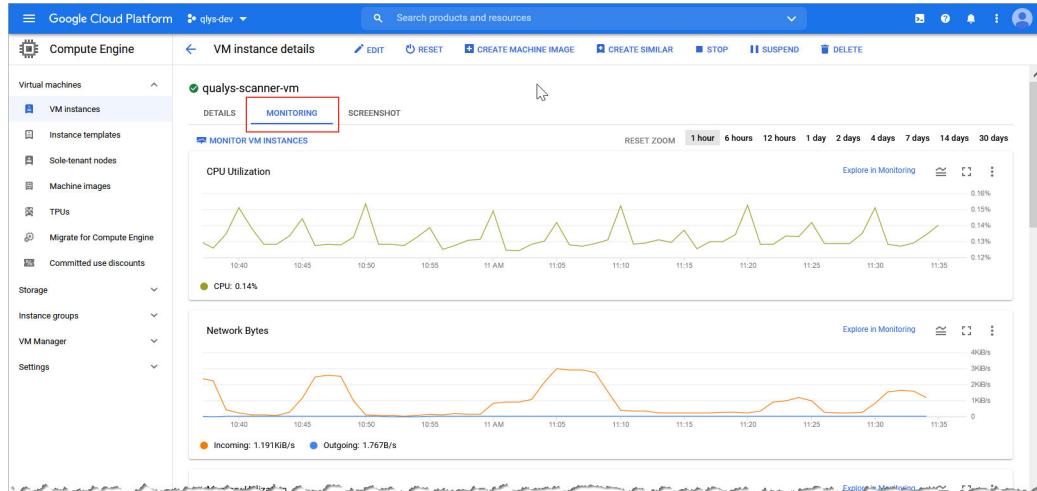

The screenshot shows the 'Serial port 1' log viewer for a VM instance named 'srcqualys-scanner-vm'. The log output is as follows:

```

Sep 14 11:08:18 srcqualys-scanner-vm kernel: BIOS-e820: 0000000000000000 - 0000000130000000 (usable)

```

In Google Compute Engine (GCE), you can also check VM status graphs for instance resources such as CPU Utilization, Disk IO and Network status:

From the Qualys Cloud Platform UI, you can check the activation status of your Qualys Virtual Scanner Appliance. Click **Check Activation** in the **Add New Virtual Scanner** dialog from where you copied the personalization code.

Learn more about [Generating a Personalization Code](#).

Indicators of Scanner Appliance Statuses

You can check the status of the virtual scanner appliance in the Qualys Cloud Platform UI. Go to Scans > Appliances and search for your appliance in the list. It can take several minutes for the Qualys user interface to get updated after you add a new appliance. Refresh your browser periodically to ensure that you see the most up-to-date details.

The following table lists the various indicators and the respective appliance status that they denote:

| Indicator | Meaning |
|-----------|---|
| | The appliance is connected to Qualys Cloud Platform and is ready to perform scans. |
| | The appliance is not connected to Qualys Cloud Platform and it's not ready to perform scans. Check to be sure your appliance is properly configured and can access Qualys Cloud Platform. |

| Indicator | Meaning |
|-----------|---|
| | The scanner is currently busy with a scan job. See preview pane for available capacity. |
| | The scanner is not busy with any scan job. |

After you see the indicator, start your internal scans. After this, you'll see the busy icon is grayed out until you launch a scan using this scanner.

Diagnosing Common Errors in Scanner Deployment

Check for errors in the output in the Serial Port 1 (console).

```

If you find issues with the personalization code, shut down the VM, fix the Metadata PERSCODE value and start the VM again. If the problem persists and the appliances are not communicating with Qualys Cloud Platform, contact [Qualys Support](#). Include your Qualys portal URL, username and attach the serial output logs to the support ticket.

For more information about the errors and the troubleshooting tips related to Qualys Virtual Scanner Appliance, see [Scanner Appliance Troubleshooting and FAQs](#).

You can install Qualys Cloud Agents (Windows and Linux) for GCP VM Instances via seamless integration of Qualys Cloud Agent solution in GCP Marketplace. This integration is a Bring Your Own License (BYOL) where only Qualys customers can use it as it requires them to use Cloud Agent Customer ID and Activation ID to configure the integration.

Deploying Qualys Cloud Agent from Google Cloud Console

Using this solution, you can configure deployment of the Qualys Cloud Agent on specified compute instances on Google Cloud Platform. Using the Cloud Agent, you can activate multiple applications on the Qualys Cloud Platform (for example, Vulnerability Management, Policy Compliance, File Integrity Monitoring) as supported for each operating system. Additionally, you can integrate these Qualys security findings (like Vulnerabilities) directly into GCP by leveraging the Qualys Integration with Google Cloud Security Command Center, which pushes these findings in Google Security Command Center.

Prerequisites For Deploying Cloud Agent From Google Cloud Console

You must have an active Qualys subscription. To buy a subscription, contact [Support](#) or [Sign up](#) from the Qualys website.

Ensure that you have the **Cloud Agent** module available and enabled in your subscription. The appropriate Customer ID and Activation ID are required to configure the installation.

Application modules such as Vulnerability Management, Policy Compliance, File Integrity Monitoring, among others, must be available and enabled.

Enable the following APIs from the Google Cloud Platform:

[Cloud OS Conf API](#)

[Compute Engine API](#)

And then, [install the OS Configuration agent](#) on your virtual machine. To know more, check the documentation for [Deploying Security Software Agents from Google Cloud Marketplace and Enabling an API](#). You can enable the OS Config and Compute APIs also by using gcloud commands through Google Cloud SDK shell.

Enable the OSConfig Agent in your project metadata. To enable this, use either of the following gcloud commands:

```
"gcloud compute project-info add-metadata --metadata=enable-osconfig=true"
```

```
"gcloud compute project-info add-metadata --metadata=enable-osconfig=true,enable-os-inventory=true,enable-guest-attributes=true,os-package-enabled=true,enable-os-config-debug=true,os-debug-enabled=true".
```

You can enable the OSConfig Agent also by using Google cloud console: [Compute Engine Metadata through GCP console](#). Setting metadata values enables OS inventory management, OS patch management and OS Configuration management, which is a prerequisite for this solution as this integration works on Google's OS configuration management feature.

Ensure that you have the following IAM permissions. If you don't, create a custom role including the following permissions. To know more, see [Creating and managing custom roles](#).

- osconfig.guestPolicies.create
- osconfig.guestPolicies.delete
- osconfig.guestPolicies.get
- osconfig.guestPolicies.list
- storage.buckets.create
- storage.buckets.get
- storage.objects.create
- storage.objects.delete

Make sure that all the VM instances that you include in the deployment process have outbound connectivity to reach Qualys Cloud Platform. Check out the [GCP support page](#) to learn more.

Getting Started with the Deployment

To start with, subscribe and configure Qualys Cloud Agent solution available on the GCP Marketplace to quickly deploy and install agents on multiple Google VM Instances with no software to maintain.

The configuration workflow follows a two-step process:

1. [Retrieving Customer ID, Activation ID and Platform Information from Qualys Subscription](#)
2. [Configuring Qualys Cloud Agent solution on GCP Console](#)

Retrieving Customer ID, Activation ID and Platform Information from Qualys Subscription

The Qualys Customer ID, Activation Id, and platform information are the required fields for configuring a Qualys Cloud Agent solution available on Google Cloud Console.

Follow the steps to retrieve Qualys Customer ID and Activation ID:

1. Log in to your Qualys subscription. Navigate to "Cloud Agent" application module from the module picker in the left, and then click the **Activation Keys** tab.

The screenshot shows the Qualys Cloud Agent interface. The top navigation bar has a dropdown menu set to "Cloud Agent". Below it, there are links for "Dashboard" and "Agent Management". The main content area has tabs for "Agent Management", "Agents", and "Activation Keys", with "Activation Keys" currently selected. A sub-header says "Ready to install cloud agents?". Below this, a message states "You'll need an activation key to get started." and features a blue "New Key" button. At the bottom of the screen, there's a footer with links for "About", "Terms of Use", and "Support".

2. Click **New Key** and generate an activation key. Specify a unique name to identify the key (for example, GCP Cloud Agent) and select Vulnerability Management and/or other cloud-agent-supported modules depending on your licenses.

New Activation Key

Create a new activation key

An activation key is used to install agents. This provides a way to group agents and better manage your account. By default this key is unlimited - it allows you to add any number of agents at any time.

Title

(no tags selected)

Provision Key for these applications

| | | | |
|--|--|---|---|

| <input type="checkbox"/> VM | Vulnerability Management 9997 Activations Remaining | <input type="checkbox"/> PC | Policy Compliance 97 Activations Remaining |
| <input type="checkbox"/> EDR | Endpoint Detection and Response 2 Activations Remaining | <input type="checkbox"/> FIM | File Integrity Monitoring 99999999 Activations Remaining |
| <input type="checkbox"/> SCA | Secure Config Assessment 9999 Activations Remaining | | |

Select the Network

Global Default Network

Set limits

We recommend that you create a Tag for GCP key and use that tag to be dynamically associated with the assets identified via the key.

You will get an acknowledgment as **New activation key generated successfully** with the Activation Key.

New Activation Key

New activation key generated successfully

Give your key a name and add tags to easily find agents installed using this key. We'll associate the tags to the agent hosts.

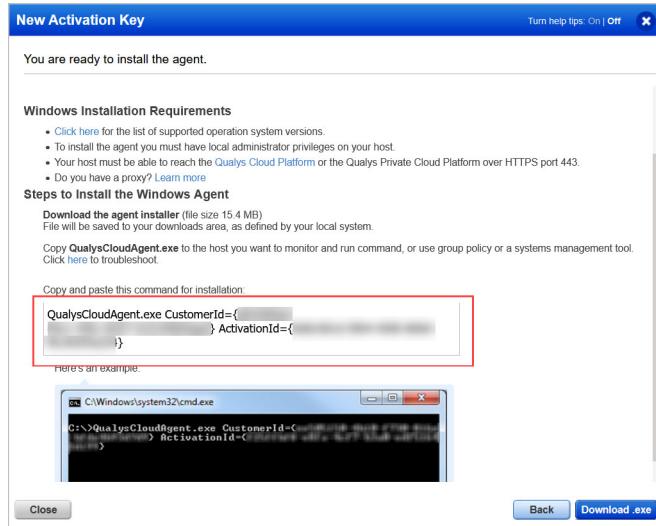

Activation Key

Key Type Unlimited key

Installation Requirements

| | | | | |
|--|----------------|-----------|--|---|
| | Windows (.exe) | x86-32/64 | Microsoft Windows Client Microsoft Windows Server | <input type="button" value="Install instructions"/> |
| | Linux (.rpm) | x64 | Red Hat Enterprise Linux CentOS Fedora OpenSUSE SUSE Enterprise Linux Amazon Linux Oracle Enterprise Linux | <input type="button" value="Install instructions"/> |
| | Linux (.rpm) | ARM64 | Red Hat Enterprise Linux CentOS Amazon Linux | <input type="button" value="Install instructions"/> |
| | Linux (.deb) | x64 | Debian Ubuntu | <input type="button" value="Install instructions"/> |
| | Linux (.deb) | ARM64 | Debian Ubuntu | <input type="button" value="Install instructions"/> |

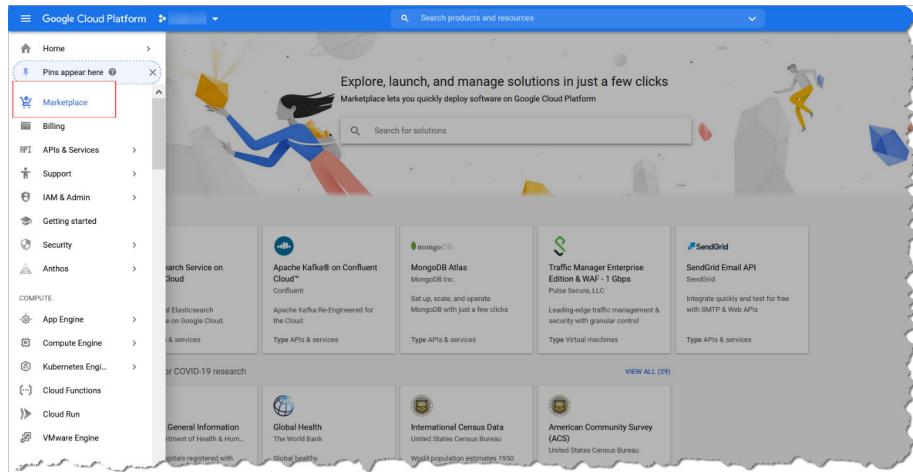

3. Currently, this integrated deployment supports only Windows and Linux agents . In the **Installation Requirements** section, click **Install Instructions** within Windows or Linux to retrieve your **Customer ID** and the **Activation ID**.

Configuring Qualys Cloud Agent solution on GCP Console

The Qualys-GCP integration leverages telemetry from the Qualys cloud agent and security findings from other Qualys apps including Vulnerability Management, Policy Compliance, FIM, IOC, Patch Management and Global Asset IT Inventory. To configure the Qualys Cloud Agent solution available in the GCP Marketplace, follow the process as mentioned below. Ensure you have completed the [Prerequisites For Deploying Cloud Agent From Google Cloud Console](#) before proceeding with the following process.

1. Go to GCP Marketplace and search for **Qualys**.

2. Click **Qualys Cloud Agent**. Another sign-up page is displayed.

The screenshot shows the Google Cloud Platform Marketplace search results for the query "qualys". There are 4 results listed:

- Qualys Cloud Agent**: Qualys, Inc. - APIs & services. Description: Continuously assesses your security and compliance posture. This item is highlighted with a red box.
- Qualys Virtual Firewall Appliance**: Qualys, Inc. - Virtual machines. Description: Protect your web applications against attacks.
- Qualys Virtual Scanner Appliance**: Qualys, Inc. - Virtual machines. Description: Continuously assesses your security and compliance posture.
- Qualys Security for Cloud SCC**: Qualys, Inc. - APIs & services. Description: Everything visible. Everything secure.

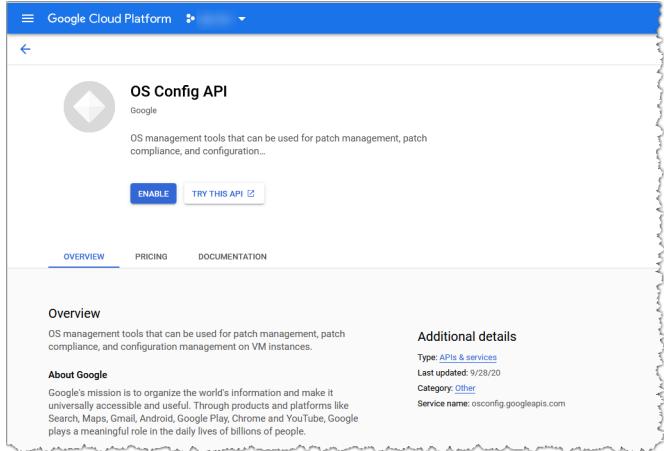

3. Click **VISIT QUALYS, INC. SITE TO SIGN UP.**

The screenshot shows the Qualys Cloud Agent product page on Google Cloud Platform. The page includes the following sections:

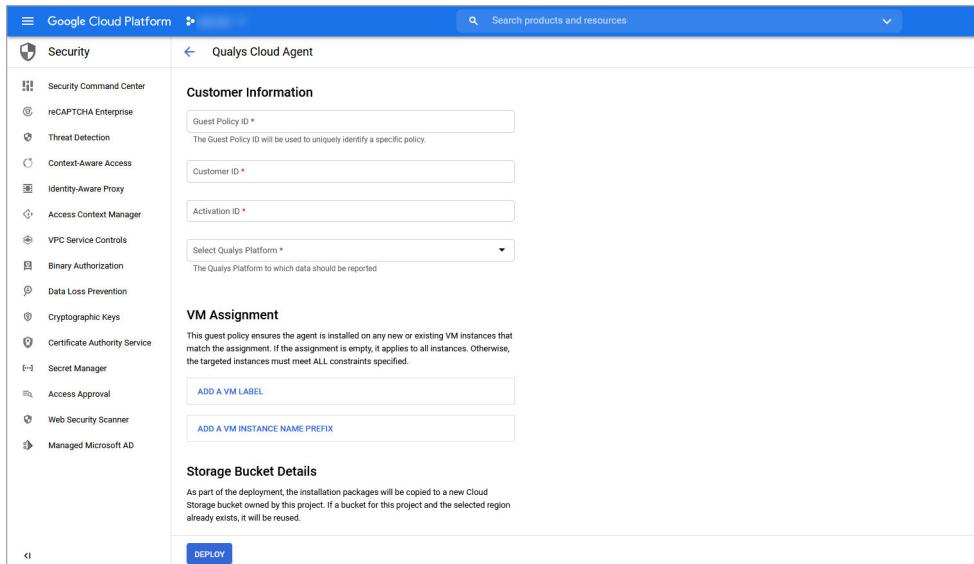

- Qualys Cloud Agent** by Qualys, Inc.
- Description: Continuously assess your security and compliance posture.
- VISIT QUALYS, INC. SITE TO SIGN UP.** (button highlighted with a red box)
- Runs on**: Qualys, Inc. Cloud Servers
- Type**: APIs & services, Billed by partner
- Category**: Security
- Overview**: A detailed description of the solution, mentioning native integration with Google Cloud Platform and various management features.
- About Qualys, Inc.**: Information about the company, including links to Learn more and About the provider.
- About managed services - billed by partner**: Information about managed services provided by the partner.

4. If you have already enabled **Cloud OS Config API**, you are redirected to the main configuration page.

5. If you haven't enabled the OS Config API, you are redirected to the **Cloud OS Config API** library page on the GCP console. To enable the OS Config API, click '**ENABLE**'. Also, make sure, you [install the OS Configuration Agent](#) as mentioned in the prerequisites.

You are redirected to the main **Qualys Cloud Agent** configuration page.

6. Specify an appropriate name as **Guest Policy ID**. For example, **qualys-demo**. Guest policy ID is used to uniquely identify a specific policy.

Note: Guest Policy ID must contain only lowercase letters, numbers and dashes.

Guest policies are created automatically.

7. Enter the **Customer ID** and the **Activation ID** retrieved from the Qualys portal.
8. From the Select Qualys Platform list, select the desired platform to which the data must be reported. Click [What's your Qualys Platform?](#) to verify your Qualys platform.
9. Select **VM Assignment**. By selecting this, the guest policy gets updated and ensures that the agent is installed on any new or existing VM instances that match the assignment. If no assignments are added, it applies to all instances. Here, you can add a label for VM instances or a VM Instance name prefix. To add a VM label, click **ADD A VM LABEL** and to add a VM Instance name prefix, click **ADD A VM INSTANCE NAME PREFIX**. After the assignment is configured, the guest policy ensures that Qualys cloud agent is installed on all those VM instances with specified labels or name prefix.
10. Select the region for the Cloud storage bucket in the **Storage Bucket Details** section and click **DEPLOY**. This deploys the Qualys cloud agent on the VM instances that match the VM assignment. A cloud storage bucket is automatically created in your project. This bucket is created to reduce the load on original source of installers. The storage buckets that are created as a part of this configuration, are synced with the original source of installers. The installers are copied automatically into this storage bucket from original source so that they are available to all the VM instances within the project. Only one storage bucket is created in the specified region (the regional parameter is a legal requirement to satisfy regulations on data localization) and can be reused to launch subsequent deployments.

Storage Bucket Details

As part of the deployment, the installation packages will be copied to a new Cloud Storage bucket owned by this project. If a bucket for this project and the selected region already exists, it will be reused.

[Learn more about bucket regions](#) 

Select region for the Cloud Storage bucket *

us

The created Cloud Storage bucket will have a name of the form: **security-agents-us-***

This completes the Qualys Cloud Agent deployment and configuration procedure.

Scanning Assets

This section helps you understand the steps to scan your network. Before you initiate your scan, you must ensure the following check points or configurations in your setup:

GCP Scan Checklist

We recommend these steps before scanning.

- [Check Appliance Status](#)
- [Configure OS Authentication](#)

Check Appliance Status

Qualys VMDR or Policy Compliance subscription, go to **Scans > Appliances** - Be sure the new Scanner Appliance is connected to the Qualys Cloud Platform. The  icon means your appliance is connected and ready for scanning.

Tips and Best Practices

Has Qualys Defined Networks? Move your Virtual Scanner Appliance

This step is recommended if you've defined custom networks in your Qualys account.

By default, a new Virtual Scanner Appliance is placed in the Global Default Network and when a scan is performed, host scan data is added to that network. We recommend you move this Virtual Appliance to the desired network before scanning a custom network.

Go to **Assets > Networks**, edit the network you want to move the Virtual Appliance to, and add the appliance to that network.

Configure OS Authentication

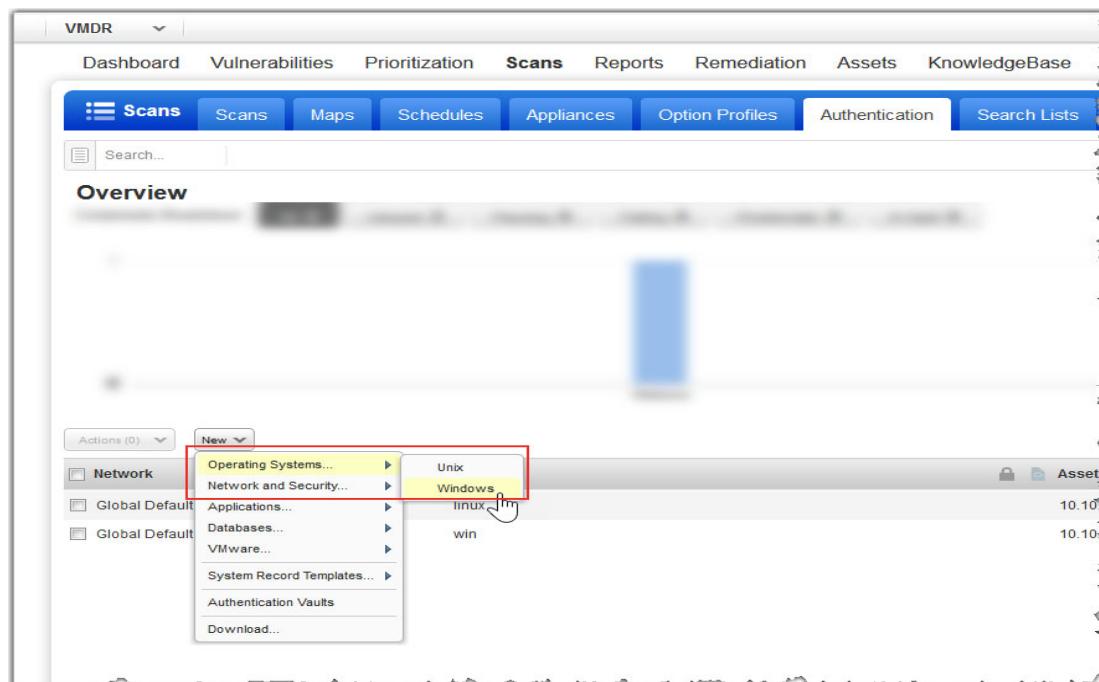

Using host OS authentication (trusted scanning) allows our service to log in to each target system during scanning. Running authenticated scans gives you the most accurate results with fewer false positives. In your Qualys VMDR subscription, go to **Scans > Option Profiles**. Edit the **Initial Options** profile, click **Save As** to save a copy with another name. In your new profile, on the **Scan** tab, enable the authentication types that you need.

Authentication

Authentication enables the scanner to log into hosts at scan time to extend detection capabilities. See the online help to learn how to configure this option.

- Windows
- Unix/Cisco
- Oracle
- Oracle Listener
- SNMP
- VMware
- DB2
- HTTP
- MySQL
- Tomcat Server
- MongoDB
- Palo Alto Networks Firewall
- Oracle WebLogic Server
- Jboss Server
- Sybase

In VMDR, go to **Scans > Authentication**. Add OS authentication records for the GCP instances that you'll be scanning - Unix and/or Windows. In the record, add credentials for the account to be used for authentication - this is an account for OS user (not the AIM user). We recommend you create a dedicated account for authentication on target systems.

The following are the sample UNIX and Windows records for your reference:

Sample UNIX Record

1. In the **New Unix Record wizard**, on the **Record Title** screen, give a name to your record and select the network.
2. On the **Login Credentials** screen, provide the username, select **Skip Password**, and select the target type.

New Unix Record

Record Title >

Authentication

Provide login credentials to use for authenticated scanning. You have the option to get the login password from a vault available in your account.

Username*:

Get password from vault NO

Skip Password

Password:

Clear Text Password

Confirm Password*:

Target Type*:

3. On the **Private Keys/ Certificates** screen, click **Add Private Key/Certificate** and then in the **Private Key / Certificate** dialog box, select the key type (RSA, DSA, ECDSA, ED25519) and enter your private key content.

Private Key / Certificate

Set private key / certificate for your Unix record

Get private key from vault: NO

Private Key Type:

Private Key Content:

*****Private Key Installed*****

Paste the private-key content into the space provided. See [Help](#) for more details

4. On the **Assets** screen, enter the Unix IP addresses or ranges of your GCP virtual machines for this record. Credentials in this record are used to scan these assets.

New Unix Record

Turn help tips: On | Off | Launch Help

Assets

Select the asset type for creating authentication record.

Asset Type: IPs/Ranges IP Range in Tag Rule Asset Tags

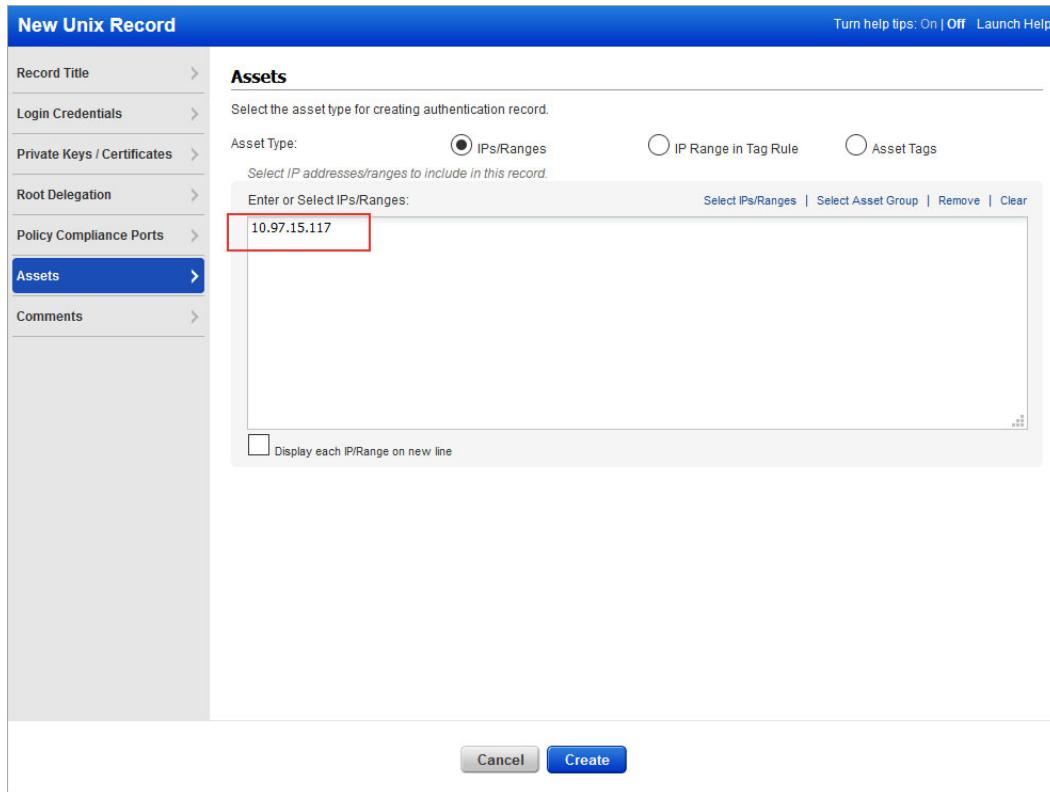

Select IP addresses/ranges to include in this record.

Enter or Select IPs/Ranges:

[Select IPs/Ranges](#) | [Select Asset Group](#) | [Remove](#) | [Clear](#)

Display each IP/Range on new line

[Cancel](#) [Create](#)

Sample Windows Record

1. In the **New Windows Record** wizard, on the **Record Title** screen, give a name to your record and select the network.

2. On the **Login Credentials** screen, enter the username and password.

The screenshot shows the 'New Windows Record' dialog with the 'Login Credentials' tab selected. The 'Windows Authentication' section has 'Local' selected. The 'Login' section shows 'Basic authentication' selected, with 'User Name: *' set to 'admin' and 'Password:' and 'Confirm Password:' both containing masked text. The 'Choose Authentication Protocols' section indicates 'NTLMv2' is checked and 'NTLMv1' is unchecked. Under 'SMB', 'SMB signing required' is unchecked and 'Minimum SMB version:' is set to 'Select'. At the bottom are 'Cancel' and 'Save' buttons.

3. On the **Assets** screen, enter the Windows IP addresses or ranges of your GCP virtual machines for this record. Credentials in this record are used to scan these assets.

Learn more about OS authentication

Online help within the authentication record workflows provides detailed instructions and guidance on all available options. These documents are good resources.

[Qualys Windows Authentication Guide \(pdf\)](#)

[Qualys Unix Authentication Guide \(pdf\)](#)

Internal Scanning using Virtual Scanning Appliance

Scanning with virtual scanner appliance involves the following sequence of steps:

1. Based on your requirements, create a dynamic tag with Cloud Asset Search filters under the Qualys AssetView module.

For example: All running VM instances in your Qualys Subscription:

gcp.compute.state:"RUNNING"

All running VM instances in your GCP Project: **gcp.compute.projectId:<your GCP Project ID> and gcp.compute.state:"RUNNING"**

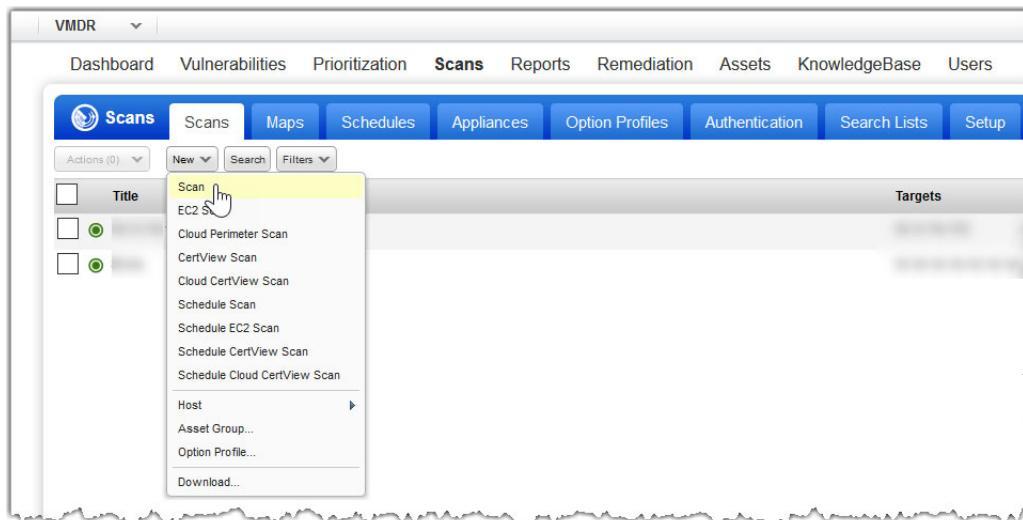

All running VM Instances in US East 1 zone: **gcp.compute.state:"RUNNING" and gcp.compute.zone: us-east1-b**

2. Extract IP addresses of machines returned by tags created in step 1. You can extract it by using Download or API Query to Host Assets.

3. Add these IP addresses grouped as Asset Groups or individually as Host Assets under Assets tab in VM or VMDR.

4. Configure OS Authentication.

5. Now, let's start scanning. Go to VM or VMDR > **Scans > Scans > New > Scan** (or **Schedule Scan**).

6. Identify your scan target. Click **Assets** to select a combination of asset groups and IP addresses to scan or click **Tags** to select one or more asset tags to scan.

General Information

Give your scan a name, select a scan profile (a default is selected for you with recommended settings), and choose a scanner from the Scanner Appliance menu for internal scans, if visible.

Title: Select

Option Profile: * Select

Processing Priority:

Network: View

Scanner Appliance: View

Choose Target Hosts from

Tell us which hosts (IP addresses) you want to scan.

Assets Tags

Asset Groups: Select

IPs/Ranges: Select

Example: 192.168.0.67-192.168.0.92, 192.168.0.200

Exclude IPs/Ranges: Select

Example: 192.168.0.67-192.168.0.92, 192.168.0.200

Temporarily add agent addresses
Select this option to add the IP addresses of any agents in your target when those IPs are not already in your subscription. They'll be added for this scan only.

Notification

Send notification when this scan is finished

Launch Cancel

7. Click **Launch**, and you're done!

Internal Network Scanning by using Qualys Cloud Agent

Using our revolutionary Qualys Cloud Agent platform you can deploy lightweight cloud agents to continuously assess your GCP infrastructure for security and compliance.

Cloud Agent features

- Communicates to the Qualys Cloud Platform over port 443 and supports Proxy configurations.
- Deployable directly on the GCP VM instances or embed in the workload images. Works well for cloud burst and ephemeral instances
- Supports scanning a range of Linux and Windows OS versions
- Supports scanning GCP instance OS vulnerabilities

For more information on Qualys Cloud Platform and Qualys Cloud Agent, we recommend the following resources:

- [Qualys Cloud Platform](#)
- [Qualys Cloud Agent Getting Started Guide](#)

Get Started

Navigate to the Cloud Agent (CA) app and install the Cloud Agent in minutes.

The screenshot shows the Qualys Enterprise interface for Cloud Agent Management. The main menu bar includes 'Cloud Agent' (selected), 'Dashboard', and 'Agent Management'. Below this, a sub-menu bar has 'Agent Management' (selected), 'Agents', 'Activation Keys', and 'Configuration Profiles'. A search bar and a 'Saved Searches' dropdown are also present. On the left, there are two main options: 'Install New Agent to deploy directly on the instance or embed into the AMIs' and 'Assign key and activate for applications (VM, PC, etc.)'. A central modal window titled 'New Activation Key' is open, prompting the user to 'Create a new activation key'. It explains that an activation key allows grouping agents and managing them better. A text input field labeled 'Title' contains 'AWSEC2AGENT'. At the bottom right of the modal are 'Select' and 'Create' buttons. A status bar at the bottom indicates 'Actions (0)', 'Install New Agent', and 'Activation Jobs'.

External Scanning using External Scanner Appliance

We provide the ability to scan public-facing virtual machines in your GCP cloud environment. You must use the standard scan workflow to scan your public-facing GCP VM instances. Create a tag for your GCP instances having a publicly assigned IP, specify IPs to be used in an standard scan workflow, select the external scanners in the scan setup and launch the scan. Also ensure that you those external IPs are activated in your Qualys subscription.

Qualys External Scanners (Internet Remote Scanners) located at the Qualys Cloud Platform are used for external scanning of GCP VM instances. For subscriptions on Private Cloud Platforms, your account may be configured to allow internal scanners to be used.

Get Started

You can run an external scan immediately or All cloud perimeter scans are scheduled - either for "now" (a one-time scan job) or "recurring". After saved, you see the scan job on the Schedules list. When the scan job starts, it appears on your Scans list.

1. Based on your requirements, create a dynamic tag with Cloud Asset Search filters under "AssetView" app.

For example,

All running public VM instances in your Qualys Subscription: not
gcp.compute.publicIpAddress is null and gcp.compute.state:"RUNNING"

All running public VM instances in your GCP Project: **not gcp.compute.publicIpAddress is null and gcp.compute.projectId: and gcp.compute.state:"RUNNING"**

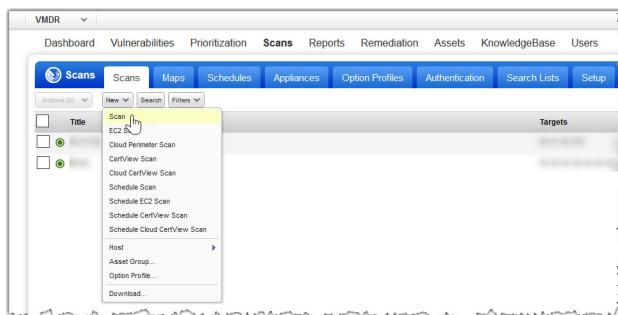

All running public VM instances in a zone: **not gcp.compute.publicIpAddress is null and gcp.compute.state:"RUNNING" and gcp.compute.zone:westus**

2. Extract IP addresses of machines returned by tags created in step 1. You can extract it by using Download or API Query to Host Assets.

3. Add these IP addresses grouped as Asset Groups or individually as host assets under the Assets tab in VM or VMDR.

4. Configure OS Authentication.

5. Now, let's start scanning. Go to VM or VMDR > **Scans > Scans > New > Scan** (or **Schedule Scan**).

6. In the Launch Vulnerability Scan window, provide the required details like scan title, option profile, and network, among others. Select the **External** scanner appliance type from the dropdown list.

7. Identify your scan targets. You can either add the exported list of IPs to an asset group or directly list the IP addresses to scan.

8. Click **Launch** and you're done!

Note that when you choose **Now**, your scan may not start immediately. We'll check for new scan requests every few minutes. If a scanner is available and you haven't reached your concurrent scan limit then we'll launch the scan. If scanners are not available or you have reached your limit then the scan will be launched at the next opportunity.

For more details on vulnerability scans, see [Scan for Vulnerabilities](#).

Cloud Inventory and Security Assessment

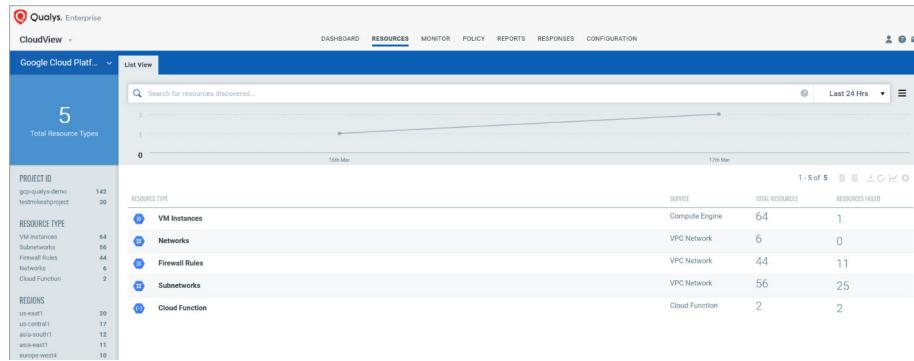

This section describes the discovery of cloud inventory such as cloud assets and resources. It also describes the security assessment giving full visibility into the public cloud security posture of all assets and resources.

Cloud Inventory

Qualys Cloud Inventory continuously discovers and tracks assets and resources such as VM Instances, Networks, Firewall Rules, Subnetworks, and Cloud Function across all regions and multiple projects in Google Cloud Platform and gives you an "at-a-glance" comprehensive picture of your cloud inventory and the location of assets across global regions. You can view all this information in one central place.

Features

- Provides a quick overview of inventory via pre-built dashboards, and lets you personalize or build your own dashboard with custom widgets.
- Collects rich metadata for every resource and shows associations across resources, so you can understand scenarios such as which firewall rules are potentially public and unprotected, and which related assets this is impacting.

Cloud Security Assessment

Qualys Cloud Security Assessment gives full visibility into the compliance posture of your cloud infrastructure against regional, industry, and government mandates by using reports and dashboards.

Refer to the [CloudView User Guide](#) for more details.

Features:

- Provides a quick overview of inventory and security posture via dashboards
- Lets you personalize or build your own with custom widgets based on queries or on other criteria, such as "Top 10 accounts based on failures" and "Top 10 controls that are failing"
- Out-of-box GCP policies like CIS Google Cloud Platform Foundation Benchmark and GCP Best Practices Policy
- Continuously assess and report on resource mis-configurations by checking against the controls from out-of-box policies
- Build your own policies and customize controls to suit your need
- Ability to view, filter, and export misconfigurations

Securing Web Applications

You can secure your applications by using the Qualys Web Application Scanning and Web Application Firewall solutions.

Qualys WAS

Qualys Web Application Scanning (WAS) provides automated crawling and testing of custom web applications to identify application and REST API vulnerabilities including cross-site scripting (XSS) and SQL injection. To get started, install the Qualys Virtual Scanner Appliance. This is the same appliance used to scan for vulnerabilities and compliance checks.

How do i get started?

- Follow the steps in You can scan your Google Cloud Compute Engine instances along with all other global elastic cloud and on-premise assets from within the Qualys Cloud Platform. Qualys Virtual Scanner Appliance can be directly deployed from the Google Marketplace.
- Then review instructions in [Qualys Web Application Scanning Getting Started Guide](#).

Qualys WAF

Protect applications with firewall rules and instant virtual patches by using Qualys Web Application Firewall (WAF).

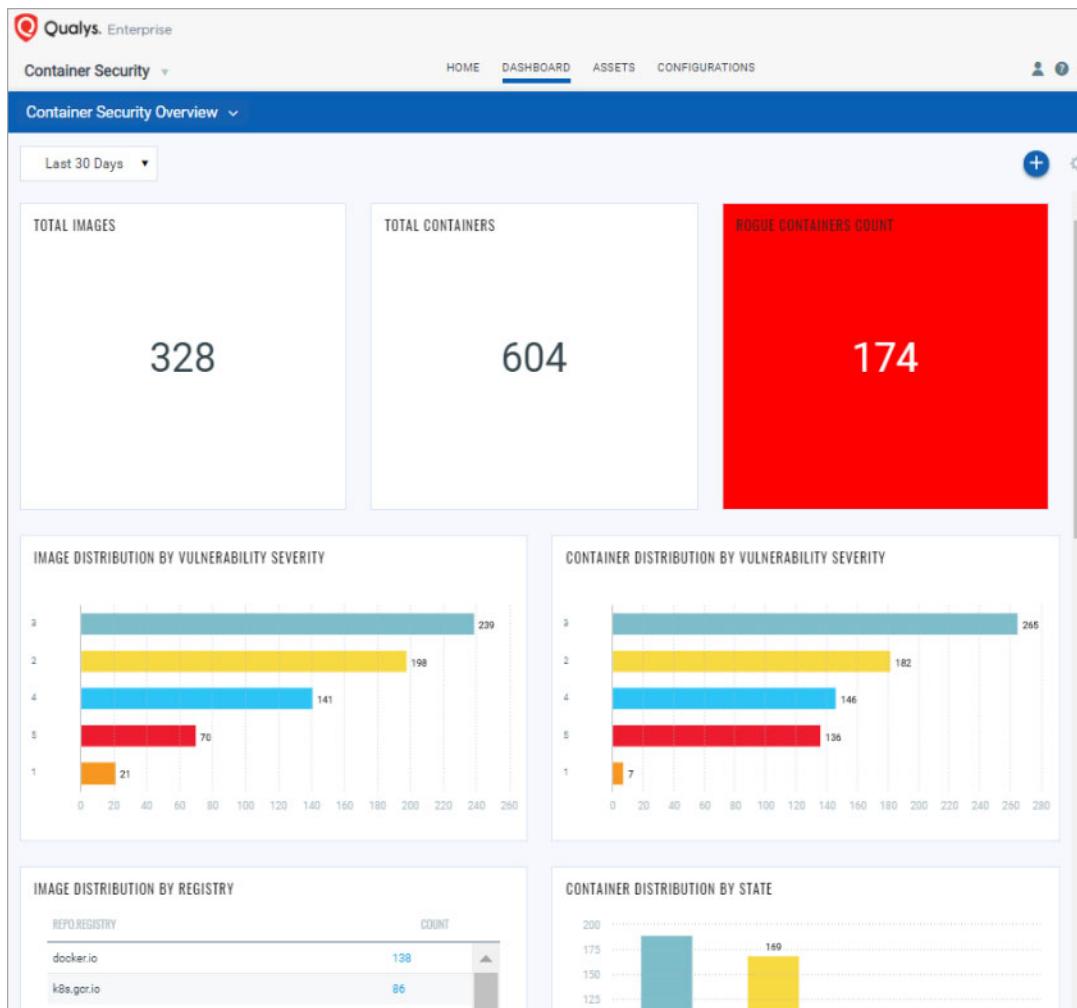

How do i get started?

- Install the Web Application Firewall Appliance available on the GCP.
- Then review instructions in Qualys Web Application Firewall Getting Started Guide.

Securing Containers

Qualys Container Security provides discovery, tracking and continuously protection to container environments. This addresses vulnerability management for images and containers in their DevOps pipeline and deployments across cloud and on-premise environments. Qualys Container Security supports:

- Discovery, inventory and near-real-time tracking of container environments
- Vulnerability analysis for images and containers
- Vulnerability analysis for registries
- Integration with CI/CD pipeline using Jenkins/Bamboo Plugins or REST APIs (DevOps flow)
- Support for GKE deployments
- Support for Google Container Registry (GCR) and Google Artifactory Registries

For more details, refer to the [Qualys Container Security User Guide](#).

Deploying Container Sensor

The sensor from Qualys is designed for native support of Docker environments. Sensor is packaged and delivered as a Docker Image. Download the image and deploy it as a Container alongside with other application containers on the host. Since they are docker based, the sensor can be deployed into orchestration tool environments such as Kubernetes, Mesos or Docker Swarm just like any other application container.

For more details, refer to the [Qualys Container Security Deployment Guide](#).

Analysis, Reporting and Remediation

This section covers - how to query assets, build widgets and dashboards, and then how to generate vulnerability reports on GCP assets.

Using Qualys Search Tokens

Our advanced search capabilities help you quickly find your asset data all in one place. In your Qualys subscription, in the module picker, choose the Qualys AssetView app and go to the Assets tab. This is where you see an inventory of all your scanned assets. Say you want to find all your GCP assets. Type provider and select GCP from the drop-down menu.

The screenshot shows the Qualys AssetView interface. At the top, there's a navigation bar with 'AssetView' and tabs for 'Assets', 'Tags', and 'Rules'. Below the navigation is a search bar with the placeholder 'provider:'. A dropdown menu is open, showing options: AWS, GCP, Azure, and OCI. The 'GCP' option is highlighted with a red box. To the right of the search bar, there's a search summary '5.10K' and sections for 'Sources' and 'Tags'.

You can search many GCP asset properties. Start typing gcp and you see a list of GCP asset properties (tokens) that you can use to search. Hover over the token name and see the syntax help to the right.

The screenshot shows the Qualys AssetView interface with the search bar containing 'gcp'. A dropdown menu is open, displaying a list of GCP asset properties: gcp.compute.hostname, gcp.compute.instanceId, gcp.compute.macAddress, gcp.compute.machineType, gcp.compute.network, gcp.compute.privateIpAddress, gcp.compute.projectId, and gcp.compute.projectNumber. These tokens are highlighted with a red box. To the right of the search bar, there's a search summary '5.10K' and sections for 'Sources' and 'Tags'.

Viewing Asset Details

The latest vulnerability and compliance data is always available in your assets inventory. Just select the asset and choose View Asset Details from the quick actions menu.

The screenshot shows the Qualys AssetView interface with the search bar containing 'gcp'. A dropdown menu is open, displaying a list of GCP asset properties: gcp.compute.hostname, gcp.compute.instanceId, gcp.compute.macAddress, gcp.compute.machineType, gcp.compute.network, gcp.compute.privateIpAddress, gcp.compute.projectId, and gcp.compute.projectNumber. These tokens are highlighted with a red box. To the right of the search bar, there's a search summary '5.10K' and sections for 'Sources' and 'Tags'.

Saving Search Query

Easily save your searches for reuse and share them with other users.

The screenshot shows the Qualys AssetView interface. A modal window titled "Create a new search" is open. Inside the modal, there's a "Search Title" field containing "My GCP Assets", which is highlighted with a yellow box. Below the title are two checkboxes: "Add this search to your favorites" and "Share this search with others". At the bottom of the modal are "Cancel" and "Save" buttons. The background of the main interface shows a list of saved searches on the left and asset details on the right, including columns for Asset Name, OS, Last Checked In, Sources, and Tags.

Downloading and Exporting Results

It just takes a minute to export search results. Select Download from the Tools menu, choose an export format, and click Download - choose from multiple formats.

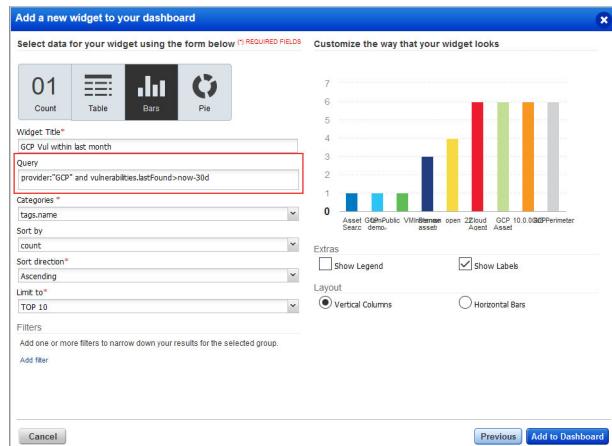

The screenshot shows the "Datalist Download" dialog box. It has a header "Select Download Format" and a note below it: "Select the download format, then click the Download button. Once the data is available, the download will begin automatically." There are seven radio buttons for download formats: CSV (selected), XML, PDF, DOC, ZIP, HTML, and MHT. Below the formats is a section for selecting a timezone: "(GMT 05:30) India Standard Time (IST Asia/Kolkata)" with a dropdown arrow. At the bottom of the dialog are "Cancel" and "Download" buttons.

Creating Widget

You can create a widget based on your query, and add it to your dashboard. For example, first search for GCP assets on which vulnerabilities were last found within past 30 days. Here's your query:

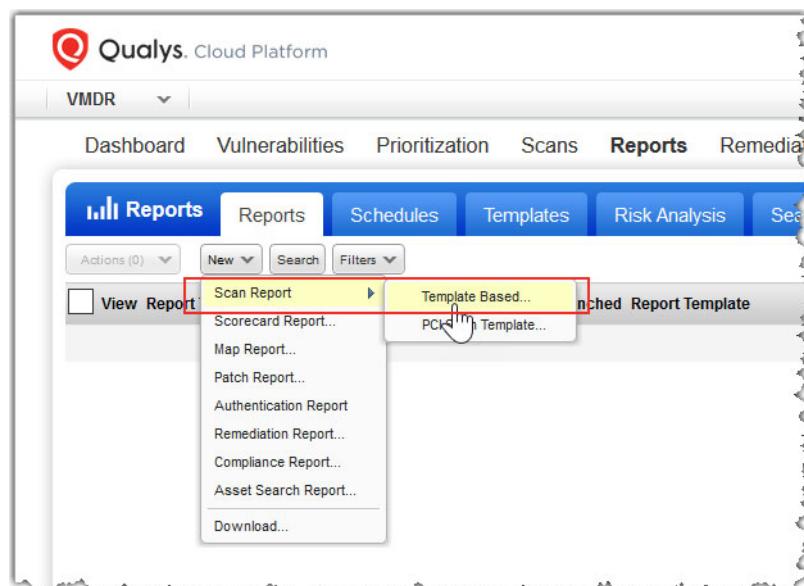

provider:"GCP" and vulnerabilities.lastFound>now-30d

Then choose Create widget. Give a title to your widget. Your query is populated for you. You can add this widget to your dashboard.

Creating Reports

You can create various reports on vulnerabilities in the Qualys VM module. Go to VM or VMDR > Reports > New > Scan Report > Template Based. You can choose from the default report templates and customize them, or create your own. Try the Technical Report to see full vulnerability details in your report.

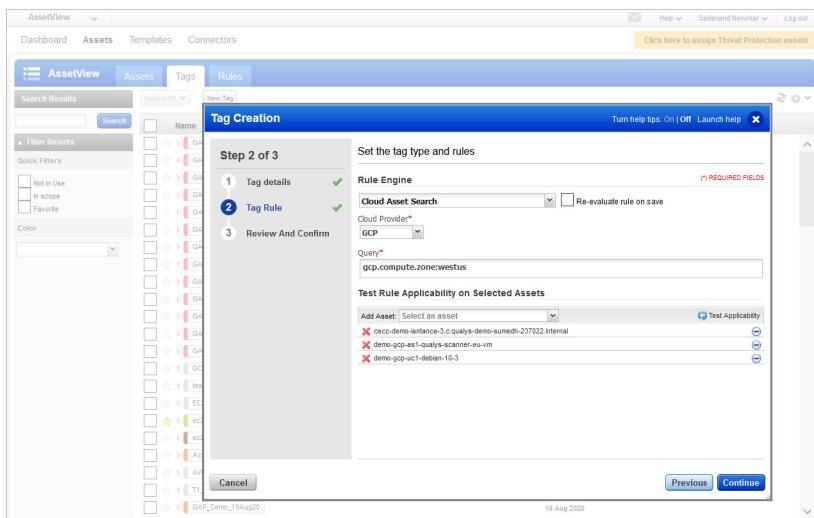

Want to report on compliance data? Choose PC from the module picker. Then go to Reports > New > Compliance Report, and pick the report you're interested in.

Dynamic Tagging by Using GCP Metadata

Create dynamic tag rules to tag your GCP virtual machine instances based on GCP metadata as collected by the Qualys Cloud Agent and Qualys Virtual Scanner Appliance. For each tag rule, you must provide a search query with GCP instance information.

It's easy to get started!

- 1) Go to AssetView > **Assets** > Tags > New Tag.
- 2) Choose the Cloud Asset Search tag rule.
- 3) Select the cloud provider.
- 4) Enter your query. Start typing in the Query field and we'll show you the GCP attributes that you can search.

Sample queries

Refer to the following sample queries:

Find GCP VM Instances located in US East 1 zone: **gcp.compute.zone:us-east1-b**

Find GCP instances that match exact value: **gcp.compute.hostname:`instance-5.c.qvsad-dev.internal`**

Find GCP VM instances within a specific GCP Project Id: **"gcp.compute.projectId:gcp-qualys-demo"**

Find GCP VM instances of specific machine type: **"gcp.compute.machineType:n1-standard-1"**

Find GCP VM instances based on IP address (comma-separated list or range):

gcp.compute.privateIpAddress:10.128.15.234

gcp.compute.publicIpAddress:335.232.131.27

Find GCP instances based on a GCP project number:

gcp.compute.projectNumber:525006500856

To know what metadata is collected by Qualys Cloud Agent and Qualys Virtual Scanner Appliance, see [GCP Metadata](#).

Organizing Assets in Qualys Subscription

Here are some best practices and tips for organizing assets and thereby securing your GCP infrastructure by using Qualys applications.

Setting up Qualys Configurations

Asset Groups - Organize assets into meaningful groups and assign them to sub-users. Asset groups are required when you have multiple user roles such as Scanner, Reader and Unit Manager (if business units are defined). The same IP address can be included in multiple asset groups.

| Title | IPs | Domains | Appliances | Business Impact | User | Modified |
|--|-------------------|---------|------------|-----------------|------------|----------|
| <input type="checkbox"/> My Asset Group | 10.10.4-10.10.255 | 0 | High | Jason Kim | 02/10/2017 | |
| <input type="checkbox"/> Windows 2003 Server Asset Group | 10.10.25.12 | 0 | High | Victor Smith | 02/12/2014 | |

Business Units - Organize users and assets into business units in a way that matches your organization. This gives Managers the ability to grant users role-based permissions in the context of their assigned business unit. The same IP address can be included in multiple business units.

| Title | Primary Contact | Users | Modified |
|---------------------------------|-----------------|-------|------------|
| <input type="checkbox"/> Asia | Carla Ming | 5 | 08/26/2016 |
| <input type="checkbox"/> Europe | Eric Conrad | 2 | 05/07/2009 |

Networks - Organize discrete private IP networks to keep overlapping IP blocks separate. When configured, Qualys tracks IPs by network and IP address. Keep in mind... An IP address must be unique to your subscription or a single network.

| Created By |
|------------------------|
| Global Default Network |

Removing Terminated Virtual Machines- You can remove terminated virtual machines from your Qualys account. Go to VM/VMDR or Policy Compliance > Assets > Asset Search and select the assets with tracking method as IP address. You could also add more parameters to refine your search such as Last Scan Data not within the past <value> days and so on.

Qualys. Enterprise

Vulnerability Management | Help | Sadanand Nerurkar (quays2mg89) | Logout

Assets Asset Groups Host Assets Asset Search Virtual Hosts Domains Networks Applications Ports/Services

DNS Hostname: beginning with

EC2 Instance ID: beginning with

Azure VM ID: beginning with

NetBIOS Hostname: beginning with

Tracking Method: IP address

EC2 Instance status: RUNNING

Azure VM state: STARTING

Operating System: beginning with View

OS CPE: beginning with

Open Ports:

Running Services: * Select

QID: with results beginning with

Last Scan Date: not within the past days

Last Scan Date (PC): within the past days

Last Scan Date (SCA): within the past days

Last Scan Date (SCAP): within the past days

First Found Date: within the next days

The screenshot shows the Qualys Enterprise interface for managing assets. The main navigation bar includes links for Vulnerability Management, Assets, Reports, Remediation, Asset Groups, Host Assets, Asset Search, Virtual Hosts, Domains, Networks, Applications, and Ports/Services. The Assets tab is currently selected. Below the navigation, there is a detailed search form with various filters. These filters include fields for tracking methods (IP address), operating systems (beginning with), and open ports. There are also sections for last scan dates (Last Scan Date, Last Scan Date (PC), Last Scan Date (SCA), Last Scan Date (SCAP)) and first found dates. The search form is quite complex, with many dropdown menus and input fields.

Click **Search** and then select the assets from the results. From the **Actions** drop-down, select **Purge**. This results in removal of assets along with their associated data from the module.

The screenshot shows the 'Asset Search Report' interface. On the left, there's a sidebar with sections like 'Assets', 'Search', 'Asset Groups', 'IPs/Ranges', and 'Tags'. The main area displays a table of assets. At the top, there's a toolbar with 'File', 'Help', and an 'Actions' dropdown. The 'Actions' dropdown is open, showing options: 'Edit', 'Edit All', 'Purge', 'Purge All', 'Add to Asset Groups', 'Add All to Asset Groups', 'Add to a new Asset Group', 'Add All to a new Asset Group', 'Remove from Asset Groups', 'Remove All from Asset Groups', 'Launch Vulnerability Scan', 'Launch Vulnerability Scan on All', 'Launch Compliance Scan', 'Launch Compliance Scan on All', 'Schedule Vulnerability Scan', 'Schedule Vulnerability Scan on All', 'Schedule Compliance Scan', 'Schedule Compliance Scan on All', 'Launch Vulnerability Scan Report', and 'Launch Vulnerability Scan Report on All'. The 'Purge' option is highlighted with a red circle and a red box around it, and a cursor arrow is pointing at it.

Uninstalling Agents

Consider a scenario where you have deployed Qualys Cloud Agents on your GCP VM instances and you want to uninstall agents that haven't checked-in for the last N days, you can use the API call.

Sample API Request:

```
curl -u "USERNAME:PASSWORD" -X "POST" -H "Content-Type: text/xml"
-H "Cache-Control: no-cache" --data-
binary@uninstall_agents_not_checkedin.xml" https://qualysapi.qualys
.com/qps/rest/2.0/uninstall/am/asset/"
```

Contents of `uninstall_agents_not_checkedin.xml`:

```
<?xml version="1.0" encoding="UTF-8" ?>
<ServiceRequest>
<filters>
<Criteria field="tagName" operator="EQUALS">Cloud Agent</Criteria>
<Criteria field="updated" operator="LESSER">2016-08-
25T00:00:01Z</Criteria>
</filters>
```

</ServiceRequest>

For more information on Cloud Agent APIs, refer to the [Qualys Cloud Agent API User Guide](#).

Frequently Asked Questions (FAQs)

| Queries | Solutions |
|--|--|
| Which organizations can leverage Qualys Integration with Google Cloud Security Command Center? | Only the organizations that already have an existing Qualys subscription that uses a Bring Your Own (Qualys) License can use this integration. |
| Can I activate other Qualys modules for assets? | Yes, you can activate multiple applications on Qualys Cloud Platform including: <ul style="list-style-type: none">- Global AssetView/CyberSecurity Asset Management- Vulnerability Management- Endpoint Detection and Response (EDR)- Secure Config Assessment- Patch Management- Policy Compliance- File Integrity Monitoring However, only Vulnerability Management security findings are available in the Security Command Center in Google Cloud, after you configure the Qualys Integration with Google Cloud Security Command Center. |
| Which Operating Systems are supported by this integration? | Qualys Integration supports Windows and Linux OS. For the complete list of supported Windows and Linux platforms, see the Cloud Agent Platform Availability Matrix for Windows and Linux in the Cloud Agent Getting Started Guide . |
| How are agent installer upgrades handled in this integration? | Qualys updates agent installers in the original source which is available to customer-specific storage buckets that are created during the Qualys Cloud Agent configuration. Even though customer-specific buckets are synced with the original source, Qualys needs to inform Google for any upgrades or updates in the original source, for Google to trigger manual sync to update customer storage buckets with the updated Qualys installers. |
| Does this integration and deployment model support proxy or Cloud Agent Gateway Service? | Proxy configuration or Cloud Agent Gateway Service is not included as a part of this deployment model. However, proxy configuration can be set after the agent has been installed. |
| Does this deployment model support a Qualys PCP? | No, this deployment model only supports utilization of the Qualys Cloud Shared Platform. |

For more details on this integration, see the [Qualys Integration with Google Cloud Security Command Center: Overview](#) section.
